

WORKFLOW ORCHESTRATION / GOVERNANCE

Automation that assists, without taking authority.

A governance-focused workflow showing deterministic routing, evidence gathering, preparation, explicit approval boundaries, execution-ready state, and auditable receipts for supervised AI-assisted operations.

WORKFLOW GOVERNANCE

Automate preparation, not authority.

Approval-Gated Workflow Orchestration

PROBLEM

Automation becomes operationally risky when preparation, approval, and execution blur together. A fast workflow still needs an explicit authority boundary for external or irreversible actions.

APPROACH

Classify the request, route it deterministically, gather evidence, prepare the work product, then stop at a visible operator approval gate. Only approved actions become execution-ready; every transition leaves a reviewable state.

Result: local automation can move quickly without hiding irreversible decisions.

The orange gate is the deliberate authority boundary: preparation may proceed; external side effects wait for explicit approval.

OPERATOR APPROVAL GATE - EXTERNAL / IRREVERSIBLE ACTIONS STOP HERE

Approve -> execution-ready -> receipt | Decline -> parked / revised

SAFE LOCAL

Local CSV normalization

Executed locally - No external side effect

APPROVAL REQUIRED

Vendor outreach draft

Prepared only - No message sent

APPROVAL REQUIRED

Marketplace publish action

Blocked at gate - No listing published
